

1.

To prove:  $(A \wedge B) \rightarrow (C \vee D)$

Premise:  $\sim D \rightarrow \sim B$

Prove by conditions:

Already known that if  $\sim D$  is true then  $\sim B$  is true by premise. This is equal to if  $B$  is true then  $D$  is true by contraposition.

Need to show that when  $(A \wedge B)$  is true then  $(C \vee D)$  is true. So, let's assume that  $(A \wedge B)$  is true, then we know  $B$  is true. Now, since  $B$  is true then  $D$  is true by what we got above.

Since  $D$  is true so  $(D \vee C)$  or  $(C \vee D)$  is true. Proof is done.

2. To prove:  $\sim C \vee \sim D$

premises:

1)  $C \rightarrow \sim(A \vee B)$

2)  $\sim B \rightarrow \sim D$

Prove by conditions:

Assume  $C$  is true, then  $\sim(A \vee B)$  is true by premise 1. And  $\sim(A \vee B)$  is just  $\sim A \wedge \sim B$  by De Morgan's laws. Based on this, we get  $\sim B$ .

And by the premise 2 we will get  $\sim D$ .

So, this means  $C \rightarrow \sim D$  which is just  $(\sim C \vee \sim D)$

3.

To prove:  $\sim B \vee \sim C$

premises:

1)  $D$

2)  $(B \wedge C) \rightarrow A$

3)  $A \rightarrow \sim D$

Proof:

By premise 1, we know that  $D$  is true.

Premise 3 says when  $A$  is true then  $D$  is not true. However, we already know that  $D$  is true, then by the modus tollens we get  $\sim A$ .

Since we have  $\sim A$  and premise 2, and still with modus tollens, we get  $\sim(B \wedge C)$ .

And by De Morgan's laws, we get  $\sim B \vee \sim C$ . The proof is done then.

4. To prove:  $(B \vee C) \rightarrow (\sim B \rightarrow C)$

$(B \vee C)$  is equivalent to  $(\sim B \rightarrow C)$

So,  $(B \vee C) \rightarrow (\sim B \rightarrow C)$ .
